

What is claimed is:

1. An appendage attachment, comprising:
a band of plastically deformable material having a first end, a second end, and a length between said first and second ends;
said band is wrappable about a user's appendage by positioning said first end proximate to the appendage and extending said length about the appendage until said second end approaches said first end; and
wherein the appendage is a genitalia or a limb, depending upon the user's selection.
2. The appendage attachment of claim 1, wherein said band, when wrapped about the appendage, maintains its position about the appendage without user intervention.
3. The appendage attachment of claim 1, wherein said band is adjustably positioned in any selected one of a plurality of positions about the appendage without user intervention.
4. The appendage attachment of claim 1, wherein said band is adjustably positioned about any selected diameter of a plurality of diameters about the appendage without user intervention.
5. The appendage attachment of claim 4, wherein said band is adjustably positioned without a fastener.

6. The appendage attachment of claim 4, wherein said band is removably positioned.
7. The appendage attachment of claim 1, wherein said limb is a part of an arm.
8. The appendage attachment of claim 1, wherein said limb is a part of a leg.
9. An appendage attachment, comprising:
 - a band of plastically deformable material having a first end, a second end, and a length between said first and second ends;
 - said band is wrappable about a user's appendage by positioning said first end proximate to the appendage and extending said length about the appendage until said second end approaches said first end;
 - a first bead secured to said first end for inhibiting contact between said first end and the appendage;
 - a second bead secured to said second end for inhibiting contact between said second end and the appendage;
 - a cover enclosing a diameter of said length, said cover extending from said first end to said second end for inhibiting contact between said length and the appendage; and
 - wherein the appendage is a genitalia or a limb, depending upon the user's selection.
10. A method for providing an appendage attachment, comprising the steps of:
 - providing a first end, a second end, and a length of plastically deformable material between the first and second ends;

wrapping the attachment about a user's appendage by positioning the first end proximate to the appendage and extending the length about the appendage until the second end approaches the first end; and

wherein the appendage is a genitalia or a limb, depending upon the user's selection.

11. The method according to claim 10, further comprising the step of securing a first bead to the first end for inhibiting contact between the first end and the appendage.

12. The method according to claim 10, further comprising the step of securing a second bead to the second end for inhibiting contact between the second end and the appendage.

13. The method according to claim 10, further comprising the step of enclosing a diameter of the length with a cover and extending the cover from the first end to the second end for inhibiting contact between the length and the appendage.
